

We claim:

1. A securing structure assembled on an end portion of a hose with corrugated metal tube for securing a hose body to a connecting part, comprising:

5 a hose body having a corrugated metal tube as an inner layer and an outer layer circumscribing a radial outer side thereof,

a connecting part arranged on an end portion of a hose,

a rigid insert pipe provided on the connecting part, the rigid insert pipe being inserted in an axial end portion of the hose body and secured to an end
10 portion of the corrugated metal tube, and

a socket fitting fitted on an end portion of the hose body, securely compressed or swaged radially inwardly to be secured to an end portion of the hose body in which the insert pipe is inserted, the socket fitting extending longitudinally of the hose beyond an inserting end of the insert pipe in a
15 direction away from an end of the hose body.

2. A securing structure as set forth in Claim 1, wherein the rigid insert pipe is formed integrally on the connecting part.
